Tier & Performance Management

Operationalizing BRQC's Data Strategy at the Point of Decision

BRQC Data Strategy — Internal Use Only

Why Tier & Performance Management is a BRQC Data Strategy Use Case

Tier & Performance Management operationalizes BRQC's data strategy at the point of decision

- BRQC's Operational Data Strategy exists to shift from tactical reporting to meaningful, actionable decision-making
- Tier systems are the daily, weekly, and monthly decision forums where this strategy must materialize
- Your work demonstrates how data maturity becomes operational behavior, not just architecture

Why this lands: This directly reflects BRQC's stated aspiration to transform ways of working and improve data maturity through operating models, not dashboards alone.

Tier Management Mapped to BRQC Levels of Design

BRQC data strategy repeatedly reinforces three levels of design — Tier is not Level 3 work alone

BRQC LEVEL OF DESIGN	YOUR TIER & DOT WORK
Conceptual	7 Business Optimizations as the evaluative lens
Behavioral	DOT matrix defining what to minimize / maximize / eliminate
Execution	Tier 1–3 boards, escalation logic, decision queues

Key message: Tier succeeds only when Levels 1 and 2 are designed intentionally. This aligns with BRQC training content warning against jumping to tools before governance and behavioral design are clear.

The DOT Matrix = BRQC Level 2 (Metrics Building)

BRQC defines Level 2 as metrics building — the DOT matrix is this artifact

- Uses **7 Business Optimizations** as the taxonomy for value
- Uses **6 Data Processes** to structure the lifecycle of each metric
- Forces every Tier metric to justify: which optimization it serves, which data process it relies on, and what decision it enables

> **Verbatim:** "The DOT matrix prevents metric sprawl by requiring explicit value justification." This is exactly how BRQC describes optimizations — as an evaluation lens, not a list of KPIs.

How Tier Metrics Are Designed (BRQC-Aligned)

Metrics written as decision signals, not activity reports

- Metrics are written as **objectives to minimize, maximize, or eliminate**
- Metrics describe **decision signals**, not activities
- **Persistence and aggregation** matter more than point values

BRQC alignment: This mirrors BRQC's emphasis on observable behaviors over outcome slogans (e.g., "reduce NCs" is not a metric). Supports BRQC's stance on avoiding Goodhart's Law in quality metrics.

Tier as Stage 2 of BRQC Digital Transformation

Tier is how BRQC builds internal efficiency before advanced analytics

TIER	BRQC TRANSFORMATION ROLE
Tier 1	Data-aware execution — signal capture
Tier 2	Diagnostic reasoning & constraint removal
Tier 3	Prescriptive, portfolio-level decisions

Key message: This mirrors BRQC's explicit framing of Tier and performance systems as diagnostic and prescriptive asks, not predictive by default.

Other BRQC Strategy Elements Reflected in TierPulse

Explicit alignment with broader BRQC strategy domains

- **Data Integrity Risks** — missing, incorrect, imprecise, irrelevant data surfaced through Tier escalation
- **Anti-fragility** — Tier escalation logic surfaces weak signals early
- **Change management** — Tier is a behavioral system, not just reporting
- **Cross-unit comparability** — DOT matrix enables horizontal comparison across sites and functions

Why This Matters to BRQC

- Your Tier & DOT work demonstrates **BRQC's data strategy in execution**
- It translates data theory into **operational behavior**
- It provides a **repeatable pattern** for other BRQC domains

> **This work shows how BRQC's data strategy becomes real at the point where decisions are made.**
